

Integration that makes sense

EME 3.0 New Features

Core Messaging Engine

EME 3.0 is based on Mule 1.4.3 Community Edition, or Mule 1.5.1 Enterprise Edition (with subscription from MuleSource). Enterprise Edition versions will include Mule HQ. Improvements in both Mule and EME code have added features, fixed bugs, and improved performance.

EME Message Viewer

The EME Message Viewer has a fresh new user interface with many improvements including new filtering options and an Endpoint-to-Integration Config File Viewer/Editor. Users can select messages by sender, receiver, and/or transaction type and restrict messages to a specified date range.

Business Document Processor (BDP)

The BDP also has a new user interface with a number of enhancements to the document filter screen. The BDP Message Viewer has 'Action Icons' for each document, including new document processing options (retry/replace/delete). Under the covers, BDP has implemented business process alerts and now displays the color-coded status of document exchange (green for good, yellow for incomplete processing, red for failed and gray for replaced).

Trac/Wiki Integration

EME 3.0 has an integrated Trac ticket management system with tightly-coupled wiki for documentation and help. The wiki provides context-sensitive help for all functions and includes access to the Trac database of problem tickets for the page. Users can submit Trac tickets on both EME and on B2B integration issues. Trac ticket management provides the framework for accountable problem resolution.

Protocol Proxy

BIT's Protocol Proxy has been enhanced and now features 'universal configuration' where a trading partner is configured once and can switch between supported protocols without further intervention. There is new graphical user interface to manage trading partner access to Protocol Proxy.
